

FIS/TradeFlex Release 2026

Extension of the returns process to increase the degree of automation

These functions were added as additional process steps in FIS/TradeFlex to map further and new possibilities for the customer-specific processing of returns. This includes, for instance, an adjustment of the refund amount or the correct entry in case of several return orders for an identical product. In this way, further special cases are covered, and the degree of automation can be increased. If tracking data of marketplaces is assigned, the corresponding process step can be skipped in FIS/TradeFlex. This accelerates the process, saves costs and reduces the susceptibility to errors.

Adjustment of the Kaufland marketplace for connecting new countries

To also integrate the new Kaufland country marketplaces in France and Italy, fields and functions were added for mapping the country-specific requirements.

Improved marketplace display

Images are now transmitted to the marketplaces with the appropriate priority to optimize the display of your own products on the marketplace. It is also possible to display specific contents for specific marketplaces in order to map target group-specific interests. Moreover, it is possible to only transmit attributes that are relevant for the marketplace.

Process of returns registration for Mirakl marketplaces

To map the Mirakl process of returns registration, the corresponding process steps were implemented in FIS/TradeFlex. This process is not available on all Mirakl marketplaces. Decathlon is an example of a marketplace using this process.

Certification for SAP Cloud ERP

SAP Cloud ERP was certified to accompany customers on their way into the cloud. This certification proves that FIS/TradeFlex complies with the clean core requirements and that the solution can be connected to the public cloud.

Function enhancement for opening up social commerce possibilities

The functionalities required for opening up new distribution channels were added. TikTok, for instance, can therefore be integrated as a new marketplace.

New marketplaces

- TikTok
- Toolineo
- Hornbach
- Allegro
- Unite

Optional enhancement

- **More current prices through optimized quotation design using the new “dynamic pricing” function**
To be able to respond to competitive prices, a competitive price of specific marketplaces can be used as a basis for pricing. This enables competitive pricing. Moreover, the SAP conditions can be used as a basis for the marketplace-specific pricing within FIS/TradeFlex.
- **Adjustment of the mapping app**
The mapping app was adjusted to prepare it for the new “category mapping” function. This makes us flexible when it comes to adding new functions. Currently, the category mapping is in its pilot phase.
