

FIS/mpm Cloud Release 2026

Provision of the business partner maintenance tool in the cloud

- FIS/mpm Cloud for business partners is provided as a cloud solution on SAP BTP.
- Accelerated processes due to new apps for the maintenance of general business partner data, vendor and customer master data are now available.
- Convenient functions such as import and export, automatic pre-assignment with default values as well as automatic and intelligent view enhancement are integrated and support a more efficient and consistent data maintenance.

Extended functional scope of FIS/mpm Cloud material master

Direct maintenance of material conditions for purchasing and sales – fewer manual steps, more transparency.

Extended individual adjustability

Extension of FIS/mpm tables to include customer-specific fields – maximum flexibility within the SAP default specifications.

Extension of the cloud solutions to include workflow automation

- Easy definition of workflows via business configuration.
- Modular principle for quick implementation and customer-specific patterns based on SAP Build Process Automation.
- Automatic start of workflows after fast entry or import and export of data are possible – for consistent process optimization.

FIS/mpm Next Generation Release 2026

Credit limit and credit standing calculation directly in the business partner app

Credit limit and credit standing check are now available in the business partner app and enable a quick and well-founded valuation based on current data.

Address display of business partners via Google Maps for improved overview

The addresses of the business partners are directly displayed via Google Maps and offer better spatial orientation for planning and coordination.

Efficient duplicate check and data completion

The duplicate check with automatic reload of SAP data reduces multiple entries and ensures consistent and complete master data.

Pre-assignment with default values for fewer entries

The pre-assignment with default values minimizes manual entries and accelerates data entry.

Optimized data correction in the workflow

The optimized data correction function in the workflow enables a quicker and traceable adjustment of information during processing.

New Fiori individual view maintenance for document master records and variant configuration

New Fiori individual view maintenance for document master records and variant configuration support a structured and clear data maintenance.

Convenient fast changes of fields using new Fiori apps

New Fiori apps enable convenient fast changes of individual fields and increase the efficiency of recurring adjustments.

Extension by adding the function for fast entry of documents

The newly added function for fast entry of documents shortens entry times and simplifies the creation of new documents.

Mapping of Fiori work items

Now, the entire workflow is also made available via Fiori work items in the inbox and can conveniently be used, for instance, on mobile devices without separate logon to SAP GUI.

New template for Fiori Launchpad areas and pages

Now, a new template for Fiori Launchpad areas and pages is available by default to enable a clear structure and intuitive navigation within the launchpad. Individual adjustments can still be made.

User-friendly display of NODATA fields

The coloured marking of NODATA fields in SAP GUI facilitates the identification of missing information and supports faster and more secure data entry.

Simplified exchange of Customizing settings

The export and import of Customizing settings in the XLSX format enables the easy maintenance, reuse and transmission of settings
